

Integrated System

The Internet and digital technology provide users with many options to expand and use their security management systems to the fullest. AXxess ViewPoint™ uses these technologies to provide end-users the highest level of security management.

Designed to use Windows® multiple screen capabilities, one screen shows the Security Management System (SMS) desktop and the second screen displays the live video views. AXxess allows users to view floor plans, alarm list or transaction logs. At the same time, on the second monitor, users are viewing any of the preconfigured camera views. The video is viewed simultaneously from different manufacturer's DVRs, NVRs, IP Cameras. A view may also include web resources for viewing public traffic cameras, news and weather sites.

The MAXxess security management system allows users to configure the system to identify events that will trigger a camera view and/or the recording of video. AXxess ViewPoint recognizes and logs events triggered by the DVR such as camera motion detection or other video analytics and logs those events into the database of the security management system. These events can additionally trigger dependencies such as sound alerts or alarms as well as visual notification to the operator.

The images can be manually selected or automatically displayed based on any event occurring within the SMS. Recorded video may be searched and displayed by selecting an event with associated video either from the transaction window or from a report. Additionally the system supports snapshots and video clips.

WebView is a web browser feature that is designed to bring Internet resources into a camera view. It supports any web resource to bring in additional information, such as traffic cameras, news or weather.

*Some Features Not Available on All DVRs

Features

- Unlimited custom views of 1 to 64 sources
- Automatic display of any view on event
- Video playback from alarm event
- Recorded video search by date/time or event
- Unlimited video servers
- WebView feature for connecting to Internet resources
- P-T-Z control
